

SuperNet

The Harris SuperNet family is a new generation of Network Communications Systems.

The first member of the family is the Harris SuperController.

Harris SuperController

The Harris SuperController features allow you to:

- Turn single function terminals into multi-function workstations
- Integrate Ethernet and IBM Token Ring networks
- Access MS.Dos and Unix applications from 3270 Coax 'A' terminals
- Share resources between all connected devices
- Access multiple IBM and ASCII hosts concurrently
- Increase network security where required

When the product was previewed by a group of consultants one of them, Dale Kutnick, E.V.P. of the Gartner Group, was moved to say:-

"If IBM do it right on the next generation of network products, this is what they would do"

That was an independent view, but we would like you to judge for yourself at one of our nationwide presentations in September which will mark the UK launch of the Harris SuperNet family.

Please return the coupon attached or telephone Anna Britnor-Guest on 0734 698787, for further information.

We look forward to seeing you in September and hearing your views on Harris SuperNet!

Yours sincerely

A G Poole
UK Sales Manager

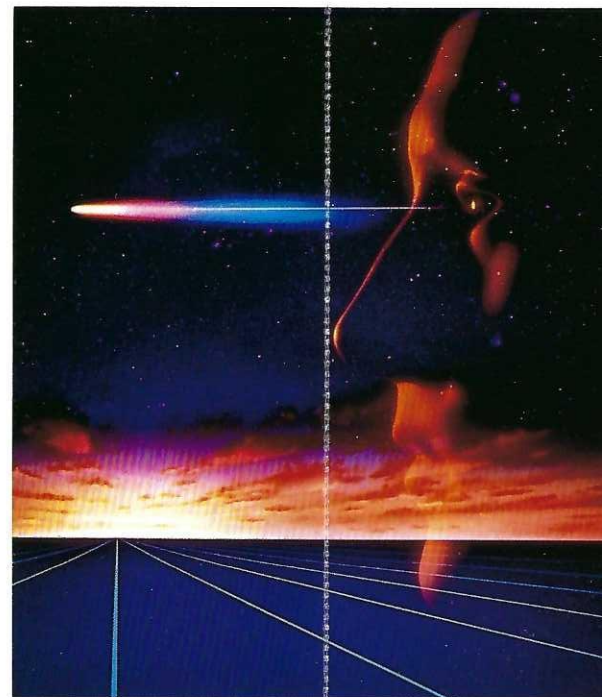

Agenda

- 9.30 am
Registration and Coffee
- 10.00 am
SuperController introduction, overview and major features
- 11.45 am
Informal hands-on demonstration
